

For those of you not quite ready for laser surgery and still want freedom from glasses, consider corneal refractive therapy. This is a revolutionary new technology used to correct nearsightedness without surgery. (Yes even for children!) The process uses a unique therapeutic lens applied to the eye at bedtime to gently reshape the cornea while you sleep. The result is crisp clear vision without contacts or glasses during your daily activities. Call for an evaluation to see if corneal refractive therapy is right for you.
